The webapp URL reflects any currently opened scene and can be bookmarked with the standard Bookmark feature of the browser (usually the Favorite "Star" button at the right in the browser's address bar).

When a request for a bookmarked scene reaches Kiwi, it will connect automatically to the GUI Server in the URL (if there's a refresh token for that GUI Server stored) and will open the bookmarked scene. If there's no refresh token available, the user will be prompted for authentication and once he/she is authenticated, Kiwi will open the scene.

The numerical suffix for the "sceneid" URL parameter can be omitted since, for now, each Kiwi application instance displays only one scene at a time. The suffix has been added just as a reminder of what will be required to change in the URL schema for Kiwi to support displaying multiple scenes simultaneously.
